# Unsupervised Topic Modeling

Text Mining with R

# Topic Models

- Topic models are algorithms for discovering the main "themes" in an unstructured corpus
- Can be used to organize the collection according to the discovered themes
- Requires no prior information, training set, or human annotation only a decision on K
   (number of topics)
- Most common: Latent Dirichlet Allocation (LDA) Bayesian mixture model for discrete data where topics are assumed to be uncorrelated
- LDA provides a generative model that describes how the documents in a dataset were created
  - Each of the *K topics* is a distribution over a fixed vocabulary
  - ► Each document is a collection of words, generated according to a multinomial distribution, one for each of *K* topics

## Latent Dirichlet Allocation

#### Key parameters:

1.  $\theta = \text{matrix}$  of dimensions N documents by K topics where  $\theta_{ik}$  corresponds to the probability that document i belongs to topic k; i.e. assuming K = 5:

```
T1 T2 T3 T4 T5

Document 1 0.15 0.15 0.05 0.10 0.55

Document 2 0.80 0.02 0.02 0.10 0.06

...
```

Document N 0.01 0.01 0.96 0.01 0.01

Fext Mining with R Simon Mun:

### Latent Dirichlet Allocation

#### Key parameters:

1.  $\theta = \text{matrix}$  of dimensions N documents by K topics where  $\theta_{ik}$  corresponds to the probability that document i belongs to topic k; i.e. assuming K = 5:

```
T1 T2 T3 T4 T5

Document 1 0.15 0.15 0.05 0.10 0.55

Document 2 0.80 0.02 0.02 0.10 0.06
```

Document N 0.01 0.01 0.96 0.01 0.01

2.  $\beta$  = matrix of dimensions K topics by M words where  $\beta_{km}$  corresponds to the probability that word m belongs to topic k; i.e. assuming M = 6:

```
W1 W2 W3 W4 W5 W6
Topic 1 0.40 0.05 0.05 0.10 0.10 0.30
Topic 2 0.10 0.10 0.10 0.50 0.10 0.10
...
Topic k 0.05 0.60 0.10 0.05 0.10 0.10
```

## Validation

#### From Quinn et al, AJPS, 2010:

#### 1. Semantic validity

• Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?

#### 2. Convergent/discriminant construct validity

- Do the topics match existing measures where they should match?
- Do they depart from existing measures where they should depart?

#### 3. Predictive validity

Does variation in topic usage correspond with expected events?

### 4. Hypothesis validity

Can topic variation be used effectively to test substantive hypotheses?

# Example

# Example: topics in US legislators' tweets

- Data: 651,116 tweets sent by US legislators from January 2013 to December 2014.
- 2,920 documents = 730 days  $\times$  2 chambers  $\times$  2 parties
- Why aggregating? Applications that aggregate by author or day outperform tweet-level analyses (Hong and Davidson, 2010)
- K = 100 topics (more on this later)
- Validation: http://j.mp/lda-congress-demo

# Extensions of LDA

## Extensions of LDA

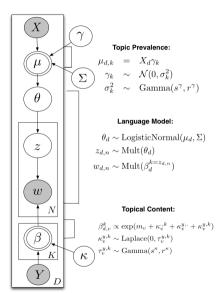

- 1. Structural topic model (Roberts et al, 2014, AJPS)
- 2. Dynamic topic model (Blei and Lafferty, 2006, ICML; Quinn et al, 2010, AJPS)
- 3. Hierarchical topic model (Griffiths and Tenembaun, 2004, NIPS; Grimmer, 2010, PA)

### Why?

- Substantive reasons: incorporate specific elements of DGP into estimation
- Statistical reasons: structure can lead to better topics.

ext Mining with R Simon Munz

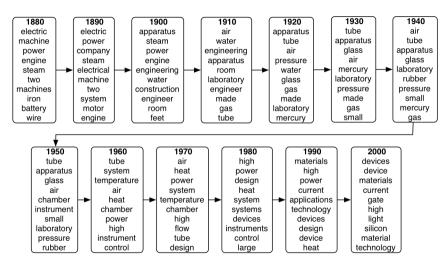

# Structural topic model

- Prevalence: Prior on the mixture over topics is now document-specific, and can be a function of covariates (documents with similar covariates will tend to be about the same topics)
- **Content**: distribution over words is now document-specific and can be a function of covariates (documents with similar covariates will tend to use similar words to refer to the same topic)

ext Mining with R Simon Munze

## Dynamic topic model
